

AMF Bruns of America is a “one-stop” provider for paratransit modification

As the nation’s Baby Boomers age, the number of wheelchair users continues to grow proportionately. As of now, the total number stands at over 3 million. According to AMF Bruns of America, Hudson, OH, a provider of wheelchair securement and occupant restraint systems, until now, within the U.S. paratransit industry, suppliers of vehicle modification products were few. Enter AMF Bruns, the German-based company founded in 1962 that developed the first wheelchair safety system and invented the world’s first four-point retractor wheelchair anchoring system in the 1970s, which opened its U.S. distribution facility as AMF Bruns of America in 2013.

Now firmly established as a global leader in the vehicle conversion market, the company’s product range includes restraint and seating systems, shoulder harnesses, head and back rests and sidesteps, and electric Euro-ramps.

“Our mission is to provide safe and passenger transport solutions to the paratransit vehicle industry,” said AMF Bruns Operations Manager Steven Kost. “Our accessibility systems and products are both safe and innovative, with flexible options that we believe improve the transportation experience and quality of life for all mobility-challenged travelers.”
